

Paypoint MVP — 2-Week Launch

v1.0 · Author **Newman Haruna** · Stakeholder **Yvonne Joseph** · 16 June 2026 · Confidential

Objective. Ship Paypoint's core loop in **2 weeks**: a seller creates a payment page in about a minute, connects Paystack, shares one link, and a stranger pays — with money settling **directly to the seller's bank via a Paystack Subaccount**. **Paypoint never holds funds**. The MVP exists to prove one thing fast: *a stranger will trust and complete a Paypoint checkout*.

1. Success Metrics (at launch)

Metric	Definition	Target
North Star — Checkout conversion	distinct buyers who pay ÷ distinct genuine checkout viewers (photo pages, ≥20 views)	≥ 40%
Onboarding speed	median time to create first page	< 90s
Time-to-first-payment (seller "aha")	median signup → first real payment	< 72h
Receipt-reach	% of initiated payments that render a receipt (incl. WhatsApp/IG in-app browser)	≥ 98%
Money records correct	Paystack-success payments stuck as <code>pending</code>	< 0.5%
Go-live proof	one real ₦100 payment, end-to-end, settling to the seller's bank	Pass

2. In Scope — Ships in 2 Weeks

- Auth & profile** — email/password + Google sign-in; profile auto-created on first login.
- Create a page** — Product/Service toggle, title, ₦ price (stored as kobo), optional photo + description + delivery, buyer fields to collect (Name on by default; Phone/Email/Address optional); URL-safe slug with reserved-word denylist; **live preview**; success panel with **Copy / QR / Share**.
- Pages grid** — cards (thumb, title, price, true paid-count), active/inactive toggle, Copy/QR/Share. (*Edit disabled at launch — fast-follow.*)
- Public checkout** `/p/:slug` (chrome-free, mobile-first) — seller logo + business name, real photo (or branded neutral state — never a placeholder icon), price, **true social proof** ("N paid", hidden at 0), tappable seller contact, "Payments processed by Paystack" trust line, collected fields, Pay button. (*CRO POs: real-photo nudge, post-payment trust line, seller contact, honest social proof.*)
- Payments** — `initialize-payment` + `verify-payment` edge functions (server re-reads price, re-checks `is_active`, idempotent settle on `paystack_reference`, **Subaccount + split**); `paystack-webhook` (signature-verified, authoritative settle); `reconciliation-sweep` (>15min `pending` → re-verify → `success` / `abandoned`).
- Receipt** — `/pay/callback` success/failed + stable `/pay/receipt/:reference` (survives a closed tab); Download PDF + Share.
- Dashboard & payments** — three metric cards (Total collected, This month, Active pages), recent payments table with status pills.
- Settings** — business name + logo; **Connect Paystack** (provisions the seller's Subaccount) with the "we never hold your money" explainer; sign out.
- Instrumentation** — `events` table + capture (`view` / `pay_tap` / `pay_initiated` / `receipt_rendered`) — without it the North Star is unmeasurable.
- "You got paid" email** to the seller on each successful payment.
- Self-test flow** — seller pays their own page once (test-mode, excluded from all counts).
- Marketing landing** `/` — built last.

3. Out of Scope (not in this 2 weeks)

Storefront / multi-product · custom domain · Pro tier & billing · Flutterwave second route · analytics dashboards · **edit-page** (Week 3–4 fast-follow) · payments search/filter · multi-currency (**NGN only**) · any funds-holding / wallet / escrow / payout · CBN PSSP

4. Non-Negotiable Architecture Decisions

- **Settlement via Paystack Subaccounts** (one per seller) — settlement routes to the seller's bank; Paypoint's commission is split by Paystack. Paypoint is **never in the money path**. *(This is the fact the entire "never holds funds" promise rests on — not the build spec's single shared key.)*
- **Webhook is the authoritative settle path**, idempotent on `paystack_reference` — callback-only loses tab-close payments and undercounts social proof.
- **events table is required** — the locked 3-table schema cannot measure the North Star.
- **Redirect to Paystack's hosted page** (no inline card field) — keeps Paypoint in the lightest PCI scope; card data never touches Paypoint.
- **Strict RLS on every table + sanitized public read by slug** — the public checkout exposes only checkout fields, never `user_id`, buyer rows, or subaccount codes.

5. Two-Week Build Plan

Days	Milestone	Exit check
1-2	Foundation: theme tokens + Inter, auth screens, app shell, schema (<code>profiles</code> , <code>pages</code> , <code>payments</code> , <code>events</code>) + RLS	Sign up → land on empty dashboard
3-4	Routing + auth guards; Create flow; Pages grid	Create a page; open its <code>/p/:slug</code> (no payment yet)
5-6	Public checkout <code>/p/:slug</code> — sanitized read, branding, CRO P0s	Checkout renders correctly on mobile @375px
7-9	Paystack (highest risk — most time): Subaccount connect, initialize/verify, webhook, reconciliation sweep, receipt + stable URL	Test-card payment → row flips <code>success</code> , settles to seller, receipt + email fire
10-11	Dashboard + payments table, receipts, settings, "you got paid" email, events capture	Metrics populate from real events
12	Marketing landing	Live at <code>/</code>
13	Go-live prep: switch to live keys, connect domain, WhatsApp/IG in-app browser device test, compliance gates	All launch gates green (\$6)
14	One real ₦100 end-to-end → announce	Money lands in seller's bank

6. Launch Gates (all must pass before announce)

Technical: live ₦100 payment settles to the **seller's** bank (not Paypoint) · webhook confirms · row → `success` with correct `customers_served` · receipt reachable by reference · seller "you got paid" email sends · RLS CI tests green · WhatsApp/IG in-app browser redirect passes the device matrix · self-test flow live. **Compliance:** lawyer opinion letter that the MVP is not a regulated payment service · written SAQ-A eligibility confirmation from Paystack · privacy policy published · DPAs executed with Supabase & Paystack · Supabase region decided. *(Several items need a Nigerian fintech lawyer — start now.)*

7. Top Risks

Risk	Mitigation
Buyers don't trust the checkout (the whole business)	Run a 50-100 real-buyer funnel test before public launch; gate on ≥60% land→pay
Redirect breaks inside WhatsApp/IG in-app browsers	Device-lab matrix on top Nigerian Android + in-app browsers with real test transactions
Payment lost when buyer closes the tab	Webhook (authoritative) + reconciliation sweep + stable receipt URL
Fund-flow makes Paypoint "accidentally regulated"	Subaccounts/split only; lead revenue with Pro subscription until lawyer-confirmed
RLS / sanitized-read leak exposes private data	CI asserts anon cannot read <code>user_id</code> , buyer rows, or subaccount codes (red blocks deploy)
Live-key / Subaccount provisioning delay	Start Paystack business verification + Subaccount setup on Day 1
